

First Pumpless Adhesive Dispensing System

Loctite® Press-Pak™ System

The Loctite Press-Pak System (patent pending) is a pumpless new-generation system designed specifically for anaerobics, abrasive-filled adhesives, and solder pastes. The Press-Pak dispenser compresses tubular, poly-film packs, delivering pressurized material downstream to a remote mounted dispense valve. Collapsible, one-liter Press-Pak 1000s contain 15% more material than the hard cartridges they replace, and consume a fraction of the space when empty, with virtually no waste.

The Press-Pak System uses the highly durable Loctite poppet-type dispense valve. Loctite Accupump and Stationary Dispense Valves are optional. An easy-to-read Press-Pak level indicator is standard. Also available

is automatic low-level switchover for dual installations where changeover downtime is unacceptable.

The Press-Pak System is a robust, environmentally friendly means of dispensing medium-to-high viscosity chemical products. It enables nearly 100% usage of available Press-Pak 1000 materials, reduces throwaway damage to a minimum, and serves as a direct replacement for the Loctite® Pump-a-Bead II™ cartridge dispensing system.
